Spring 2024

## Assignment 4 (Deadline: 6:00pm on 31 May 2024)

Prof Hongseok Yang

Submit your solutions in KLMS. (Reminder: We adopt a very strict policy for handling dishonest behaviours. If a student is found to copy answers from fellow students or other sources in his or her homework submission, she or he will get F.)

- 1. Express the following by formulas of first-order logic, using predicate H(x) for "x is happy", R(x) for "x is rich", G(x) for "x is a graduate", and C(x,y) for "y is a child of x".
  - (a) Any person is happy if all their children are rich.
  - (b) All graduates are rich.
  - (c) Someone is a graduate if she or he is a child of a graduate.
  - (d) All graduates are happy.

Use first-order resolution (i.e. unification-based resolution) to show that (d) is entailed by (a), (b) and (c). Indicate the substitutions in each resolution step.

(25 points)

2. Let F and G be quantifier-free formulas of first-order logic such that  $F \models G$ . Show that there is a formula I that uses only variables, constant symbols, functions symbols and predicate symbols that are common to both F and G, such that  $F \models I$  and  $I \models G$ .

[Hint: One possibility is to use the propositional version of this result from Homework Assignment 1. But carefully justify your reasoning.]

(25 points)

3. Let  $\sigma$  be a fixed signature with at least one constant symbol. Professor Long claims that given closed formulas F and G over  $\sigma$  in Skolem form, if every Herbrand model of F over  $\sigma$  is a Herbrand model of G then  $F \models G$ . Is Professor Long correct? Justify your answer.

(25 points)

- 4. A closed formula (i.e., formula without free variables) is in the class  $\exists^* \forall^*$  if it has the form  $\exists x_1 \dots \exists x_m \forall y_1 \dots \forall y_n F$ , where F is quantifier-free and  $m, n \geq 0$ .
  - (a) Prove that if a closed  $\exists^*\forall^*$ -formula over a signature with no function symbols has a model, then it has a finite model.

(8 points)

(b) Suggest an algorithm for deciding whether a given closed  $\exists^*\forall^*$ -formula over a signature with no function symbols has a model.

(8 points)

(c) A closed formula is in the class  $\exists^*$  if it has the form  $\exists x_1 \dots \exists x_m F$ , where F is quantifier-free and  $m \geq 0$ . Prove that the validity problem for the class of closed  $\exists^*$ -formulas that may mention function symbols is undecidable.
